Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	5 Marks

Project Proposal (Proposed Solution) report

The proposal report presents a ServiceNow script-controlled Access Control List (ACL) solution for restricting record access based on field values and user roles. It addresses unauthorized viewing, creation, modification, and deletion of records.

Project Overview	
Objective	To implement a script-controlled Access Control List (ACL) in ServiceNow that restricts record access according to user roles and the Branch field value.
Scope	The project covers creation of users and roles, a custom Institution Details table, and READ, CREATE, WRITE, and DELETE ACLs for u_institution_details.
Problem Statement	
Description	Unauthorized users may be able to view or modify records when access is not controlled according to roles and record field values.
Impact	The solution enforces record-level access control and helps protect sensitive records from unauthorized viewing, modification, creation, and deletion.
Proposed Solution	
Approach	Use ServiceNow ACLs with custom roles and a script/data condition so that EEE branch records are accessible to authorized users, while administrators retain full access.
Key Features	- Custom roles bb1, bb2, bb3 and bb4. - READ ACL with Branch = EEE condition and script control. - CREATE, WRITE and DELETE ACLs using role-based permissions.
	The project verifies access by impersonating users and administrators. Users with the required roles receive the corresponding permissions, while users without the required access are denied.

Resource Requirements

Resource Type	Description	Specification/Allocation
ServiceNow		
User & Role Management	Test user and custom roles	EEE User; bb1, bb2, bb3, bb4
Custom Table	Record storage for access-control testing	u_institution_details / Institution Details
Record Fields	Fields used in the custom table	Student Roll Number, Student Name, Faculty Name, Branch, Email, Phone Number, Description
System Security → Access Control (ACL); Security_admin elevation		
READ ACL	Controls record viewing	Role bb1; Branch is EEE; Advanced script
CREATE ACL	Controls record creation	Role bb2
WRITE ACL	Controls record editing	Role bb3
Role bb4		
Verification	Access validation	Impersonate EEE user and Admin; verify list/form permissions
